Did you know...

On site at RAL is the JASMIN Supercomputer maintained by CEDA and STFC. The system is built from many individual components arranged on boards like the one above, with various different sockets for different connectors and fans to keep things cool. The whole JASMIN system can store around 45 Petabytes of information. That's enough to store the Complete Works of Shakespeare 12,500,000,000 times!
